In [5]: df.head()
```

	total	speeding	alcohol	not_distracted	no_previous	ins_premium	ins_losses	abbrev
0	18.8	7.332	5.640	18.048	15.040	784.55	145.08	AL
1	18.1	7.421	4.525	16.290	17.014	1053.48	133.93	AK
2	18.6	6.510	5.208	15.624	17.856	899.47	110.35	AZ
3	22.4	4.032	5.824	21.056	21.280	827.34	142.39	AR
4	12.0	4.200	3.360	10.920	10.680	878.41	165.63	CA

```
In [6]: sns.scatterplot(x="speeding",y="total",data=df)
```

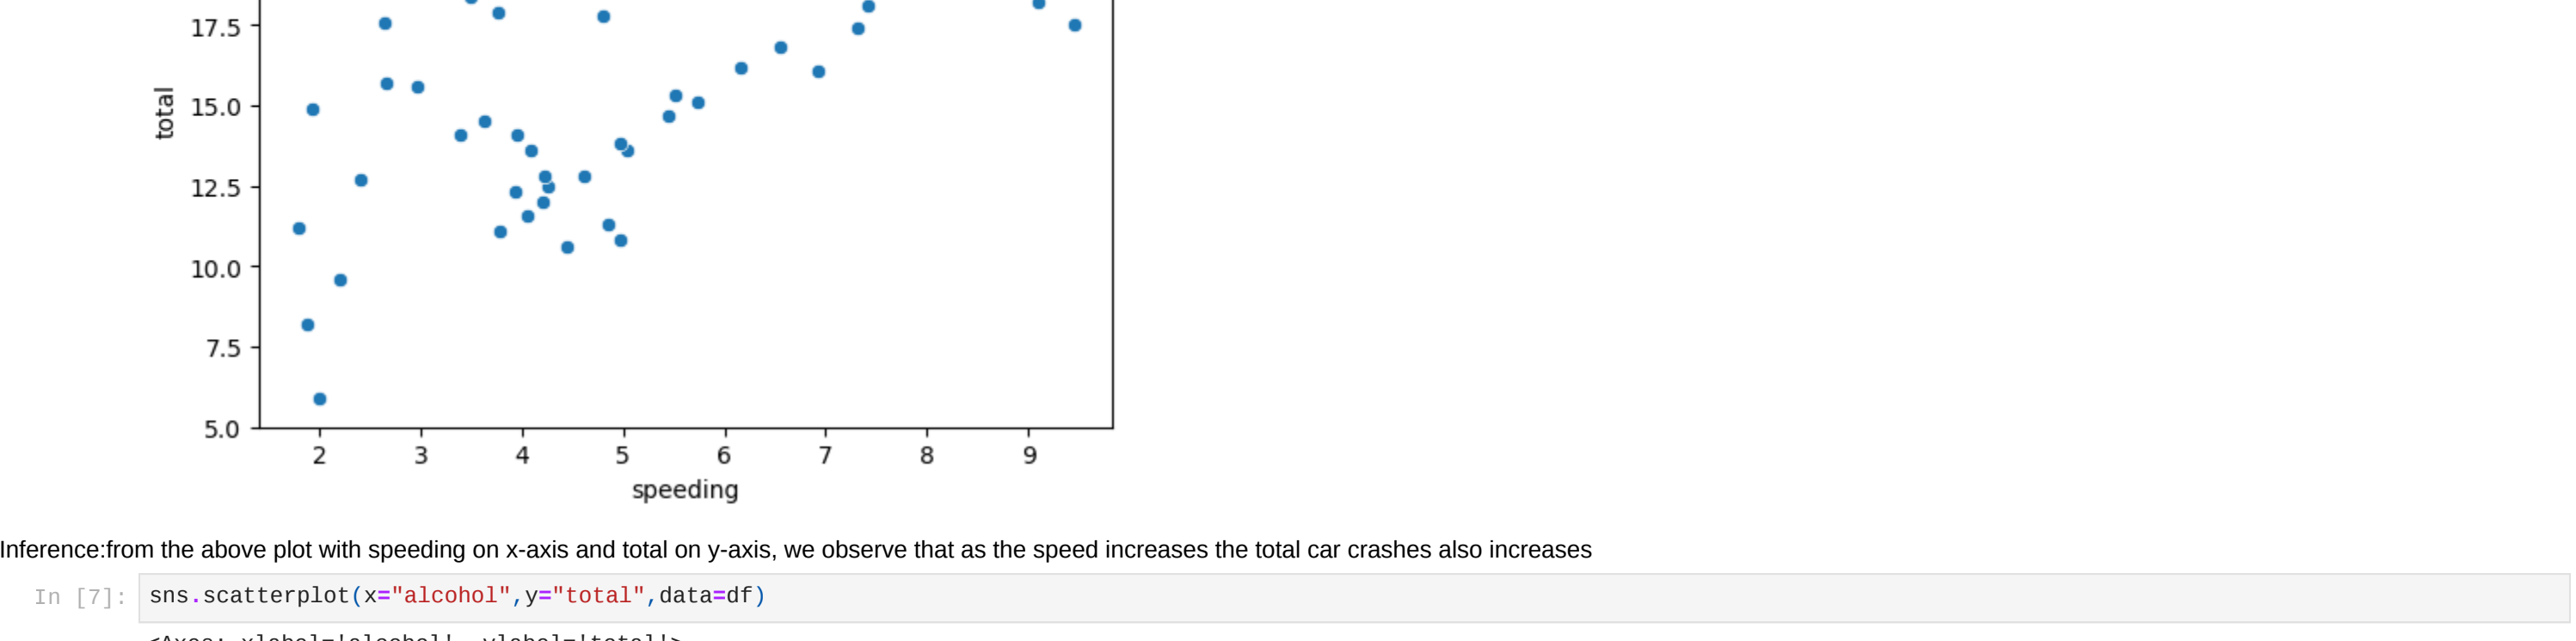

```
<Axes: xlabel='speeding', ylabel='total'>
```

Inference:from the above plot with speeding on x-axis and total on y-axis, we observe that as the speed increases the total car crashes also increases

```
In [7]: sns.scatterplot(x="alcohol",y="total",data=df)
```

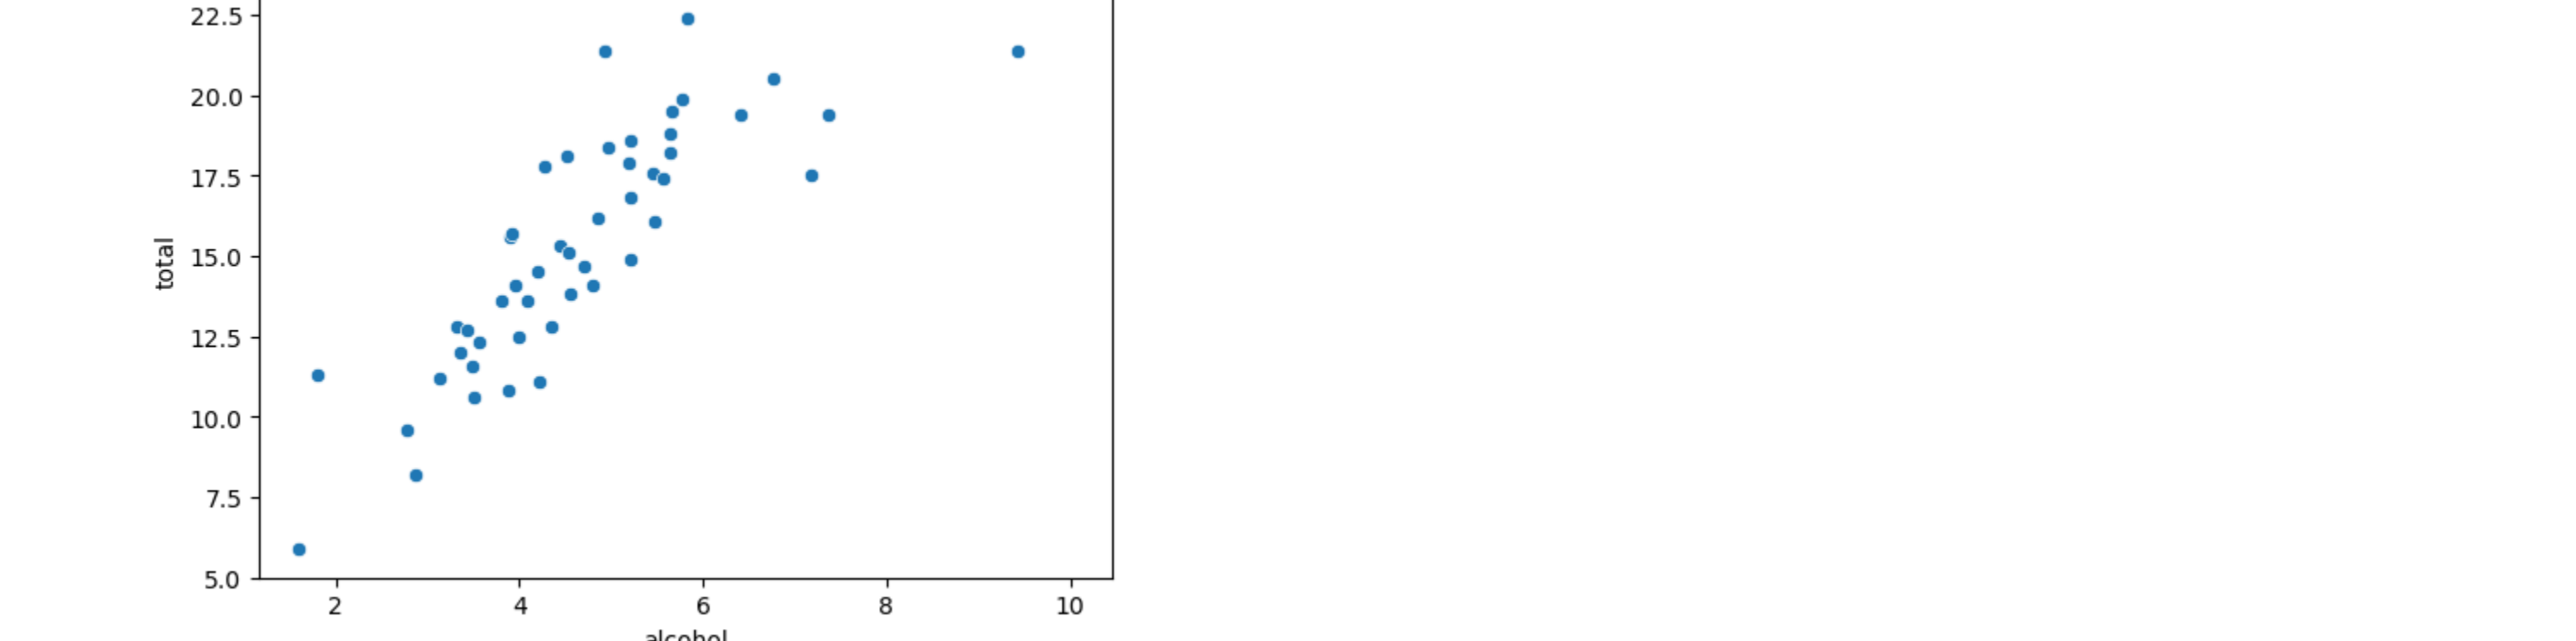

```
<Axes: xlabel='alcohol', ylabel='total'>
```

Inference: from the above plot with alcohol on x-axis and total on y-axis, we observe that as more the alcoholic more the car crashes increases

```
In [11]: sns.lineplot(x="alcohol",y="total",data=df,ci=None)
```

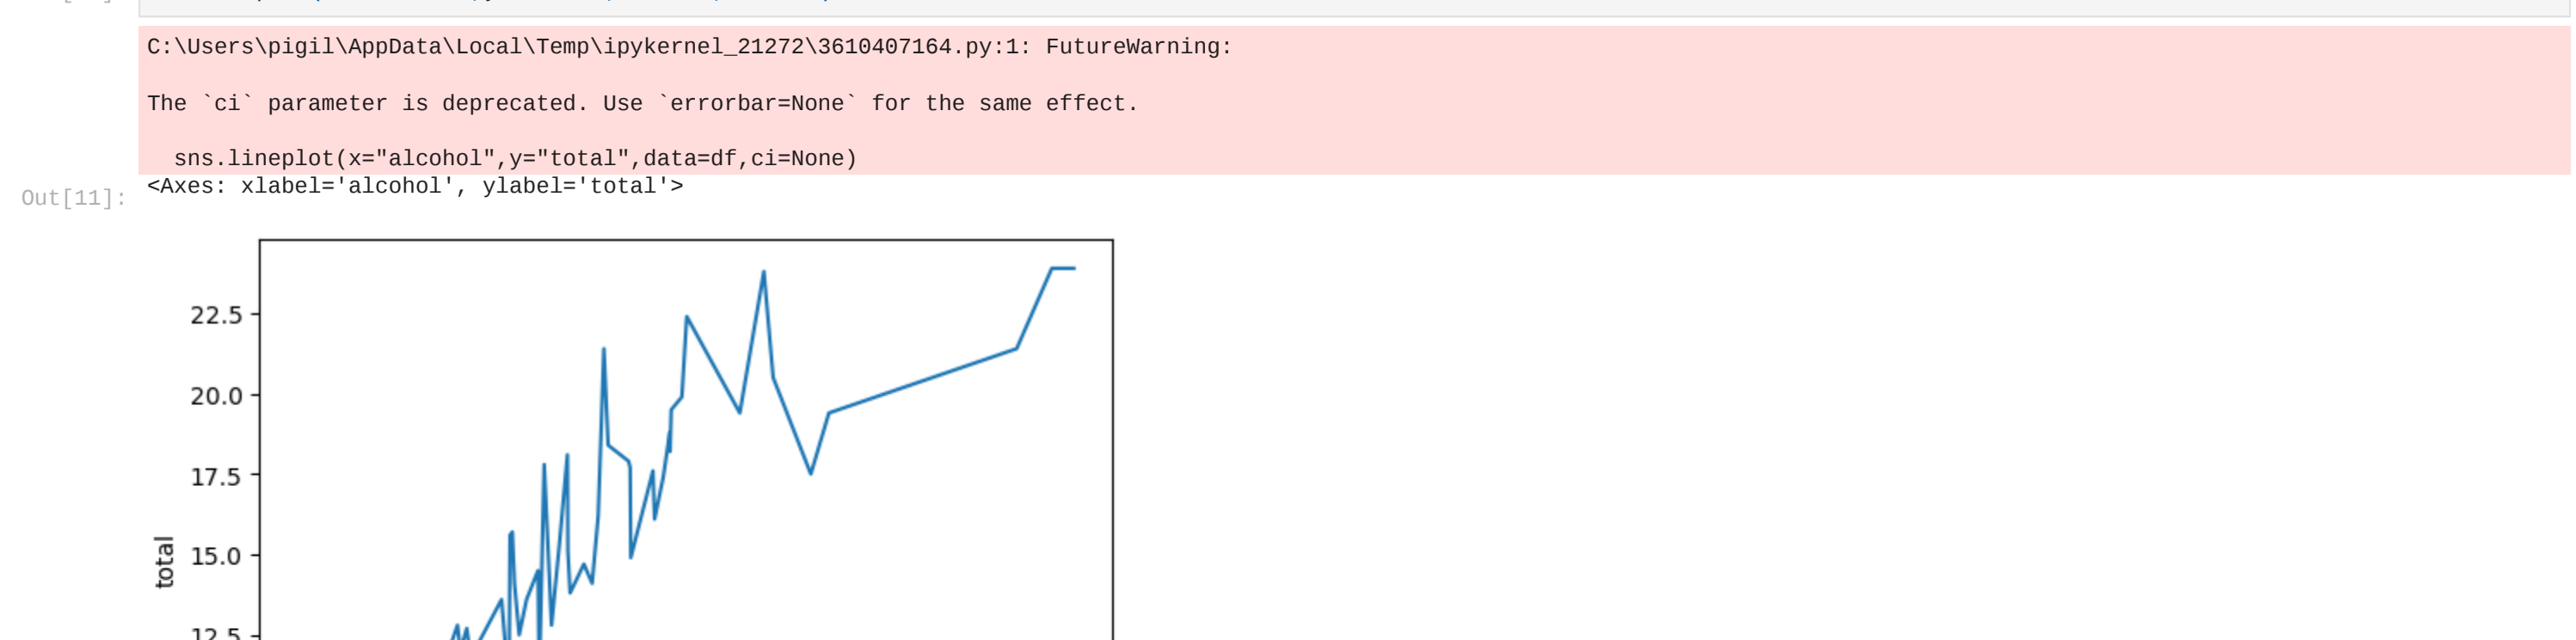

```
<Axes: xlabel='alcohol', ylabel='total'>
```

Inference: from the above plot with alcohol on x-axis and total on y-axis, we observe that as more the alcoholic more the car crashes increases

```
In [12]: sns.lineplot(x="speeding",y="total",data=df,ci=None)
```

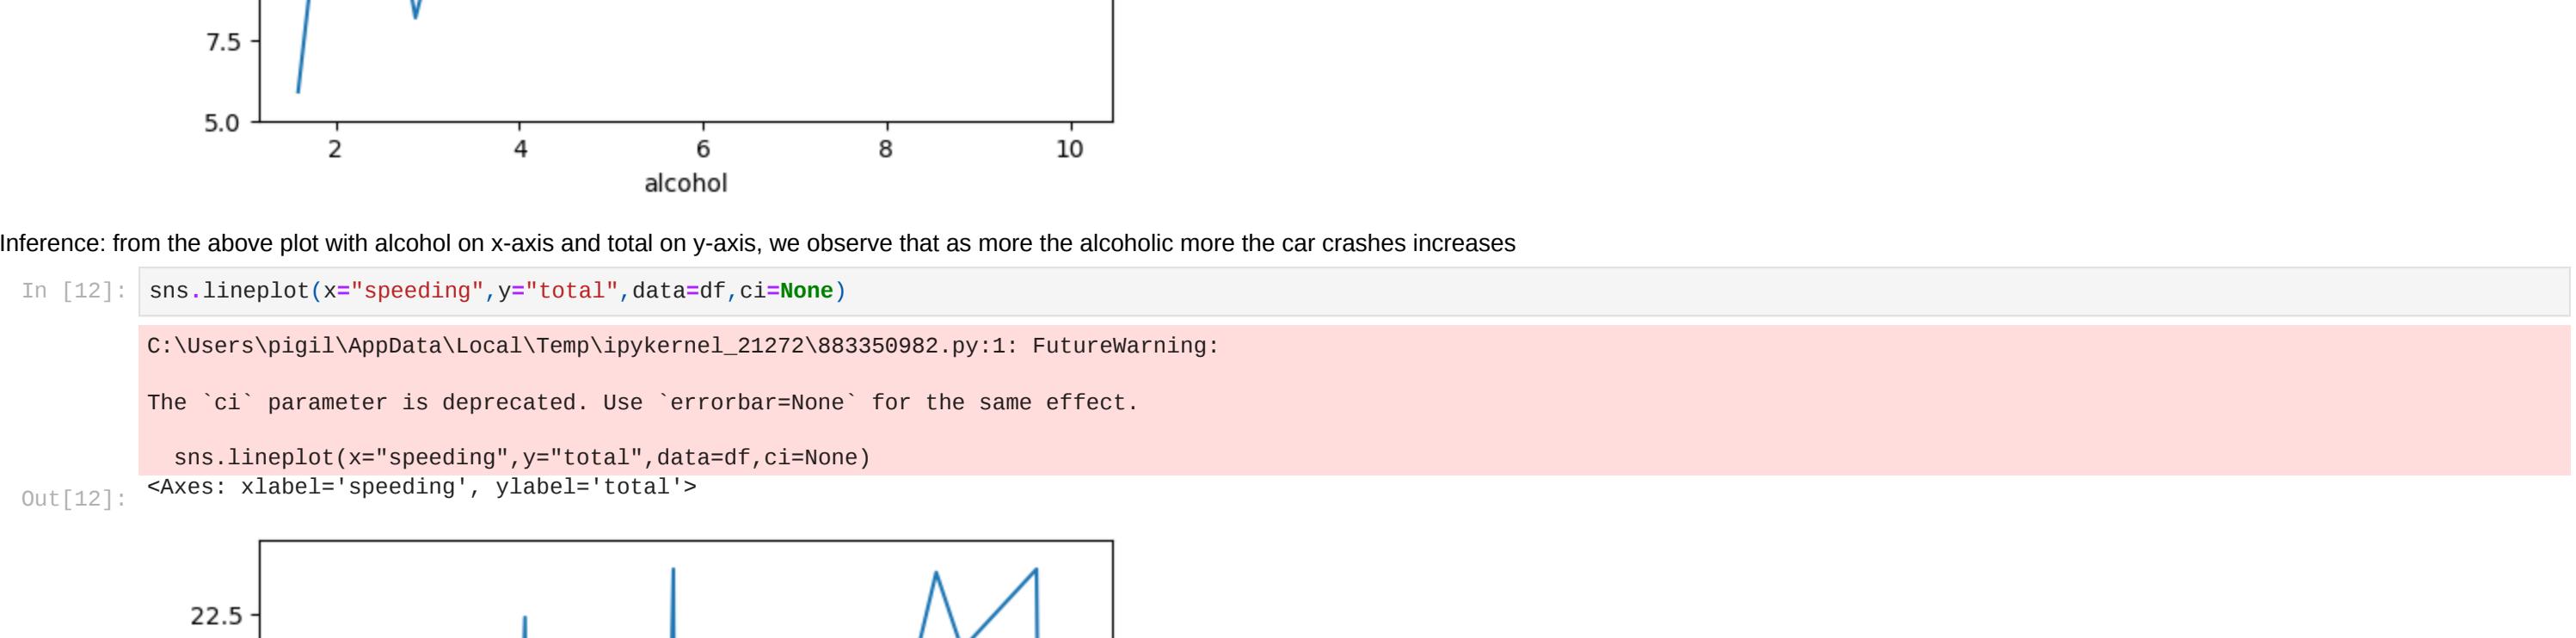

```
<Axes: xlabel='speeding', ylabel='total'>
```

Inference: from the above plot with speeding on x-axis and total on y-axis, we observe that as more the speeding more the car crashes increases

```
In [14]: sns.distplot(df[["total"]])
```

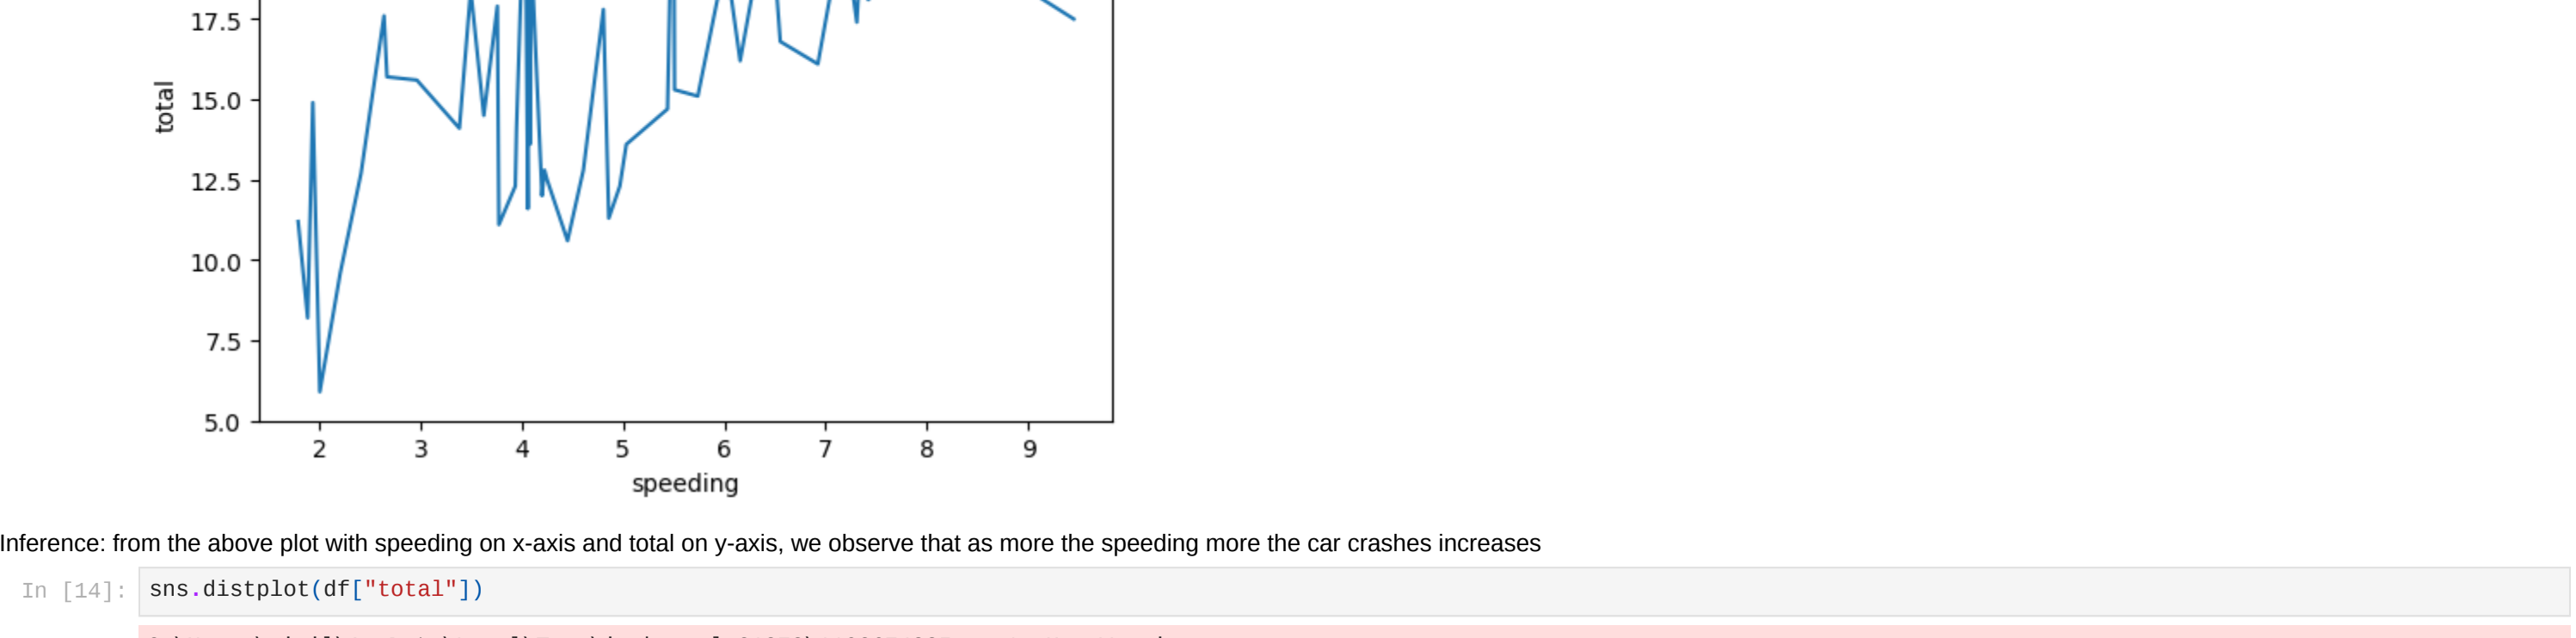

```
<Axes: xlabel='total', ylabel='Density'>
```

Inference:from the above plot is about the density of the total car crashes where there is huge increase at a point total=15 and density=0.08

```
In [16]: sns.relplot(x="speeding",y="total",data=df,hue="alcohol")
```

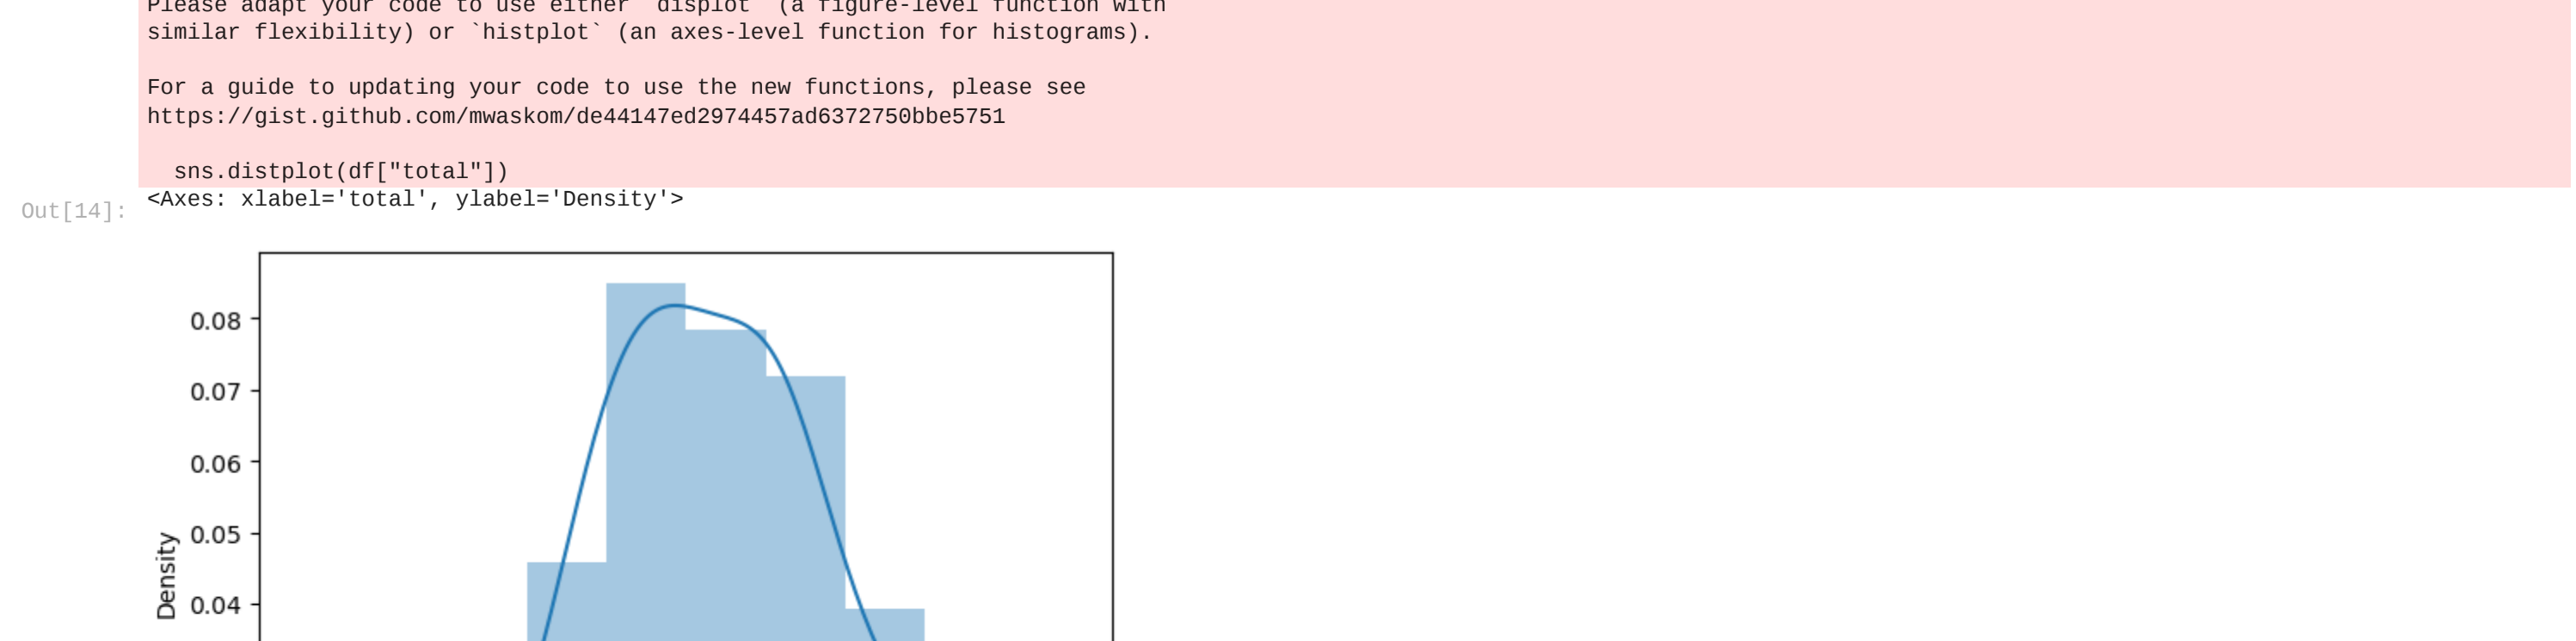

```
<seaborn.axisgrid.FacetGrid at 8x19c67ca37d0>
```

Inference: from the above plot with speeding on x-axis and total on y-axis and alcohol as our another feature of plotting as relation between speeding with alcohol and total car crashes, we observe that as more the speeding along with alcohol more the car crashes increases.

```
In [17]: sns.barplot(data=df,x="speeding",y="total",ci=None)
```

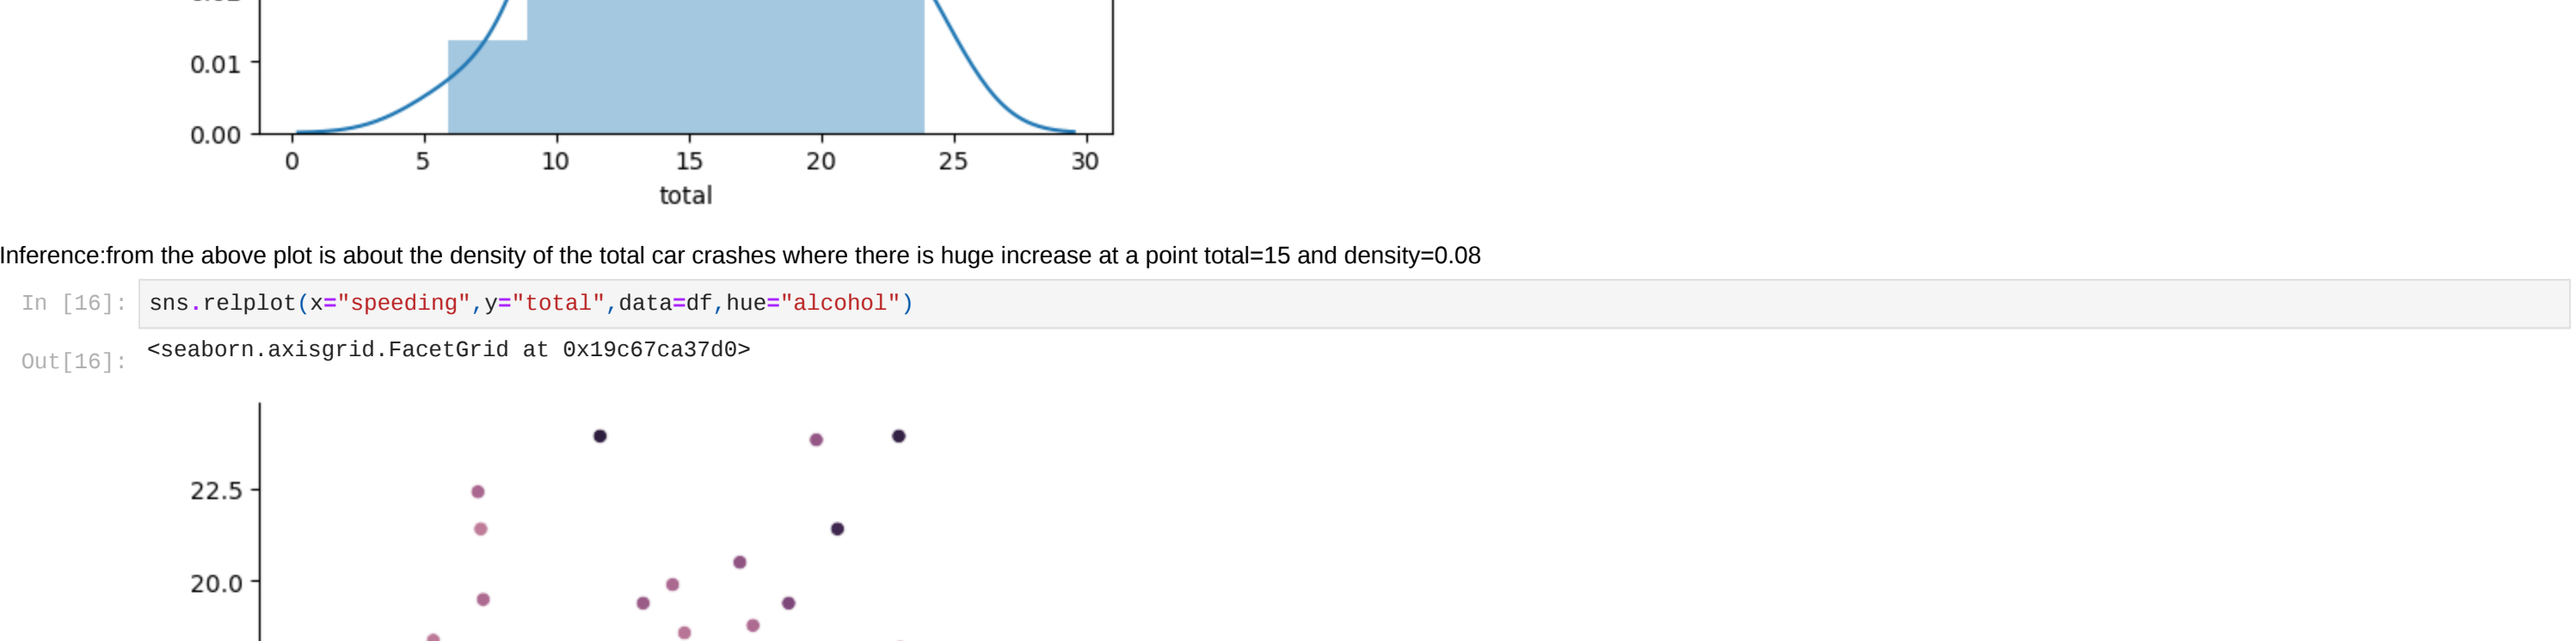

```
<Axes: xlabel='speeding', ylabel='total'>
```

Inference:In the above barplot, the relation between speeding and total. we observe that there increase of total car crashes with increase in speed

```
In [33]: sns.countplot(x="total",data=df)
```

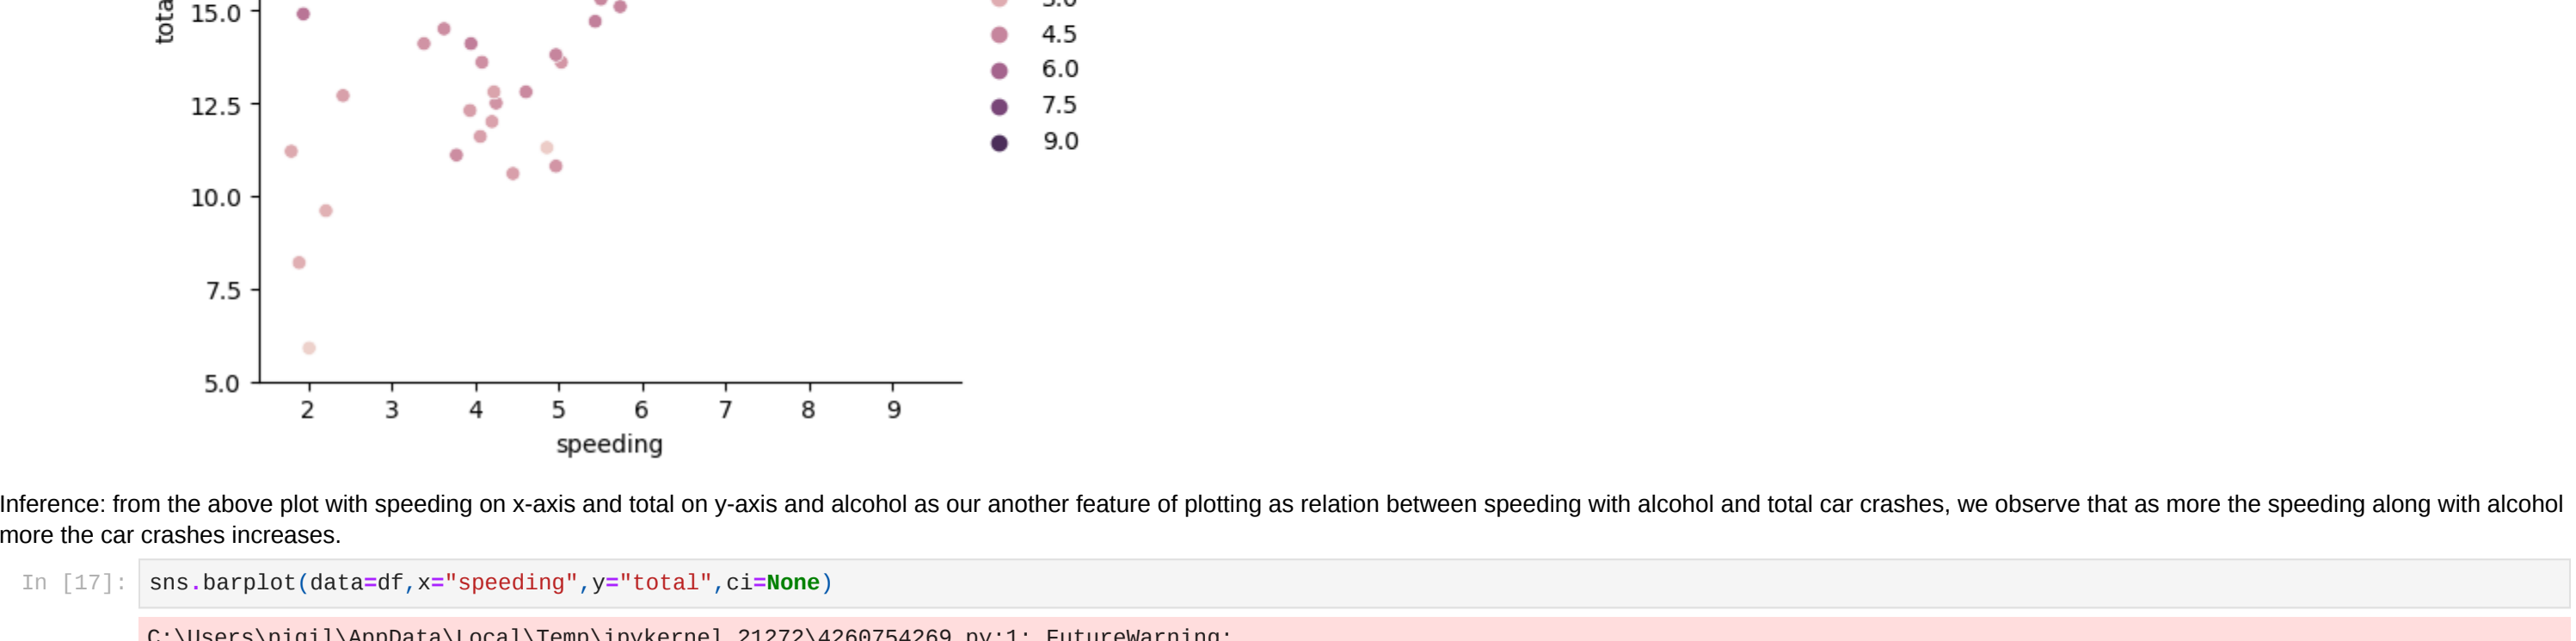

```
<Axes: xlabel='total', ylabel='count'>
```

Inference: In the above plot we have total car crashes on x-axis and count on y-axis, which shows total count of car crashes.

```
In [34]: sns.jointplot(x="speeding",y="total",data=df)
```

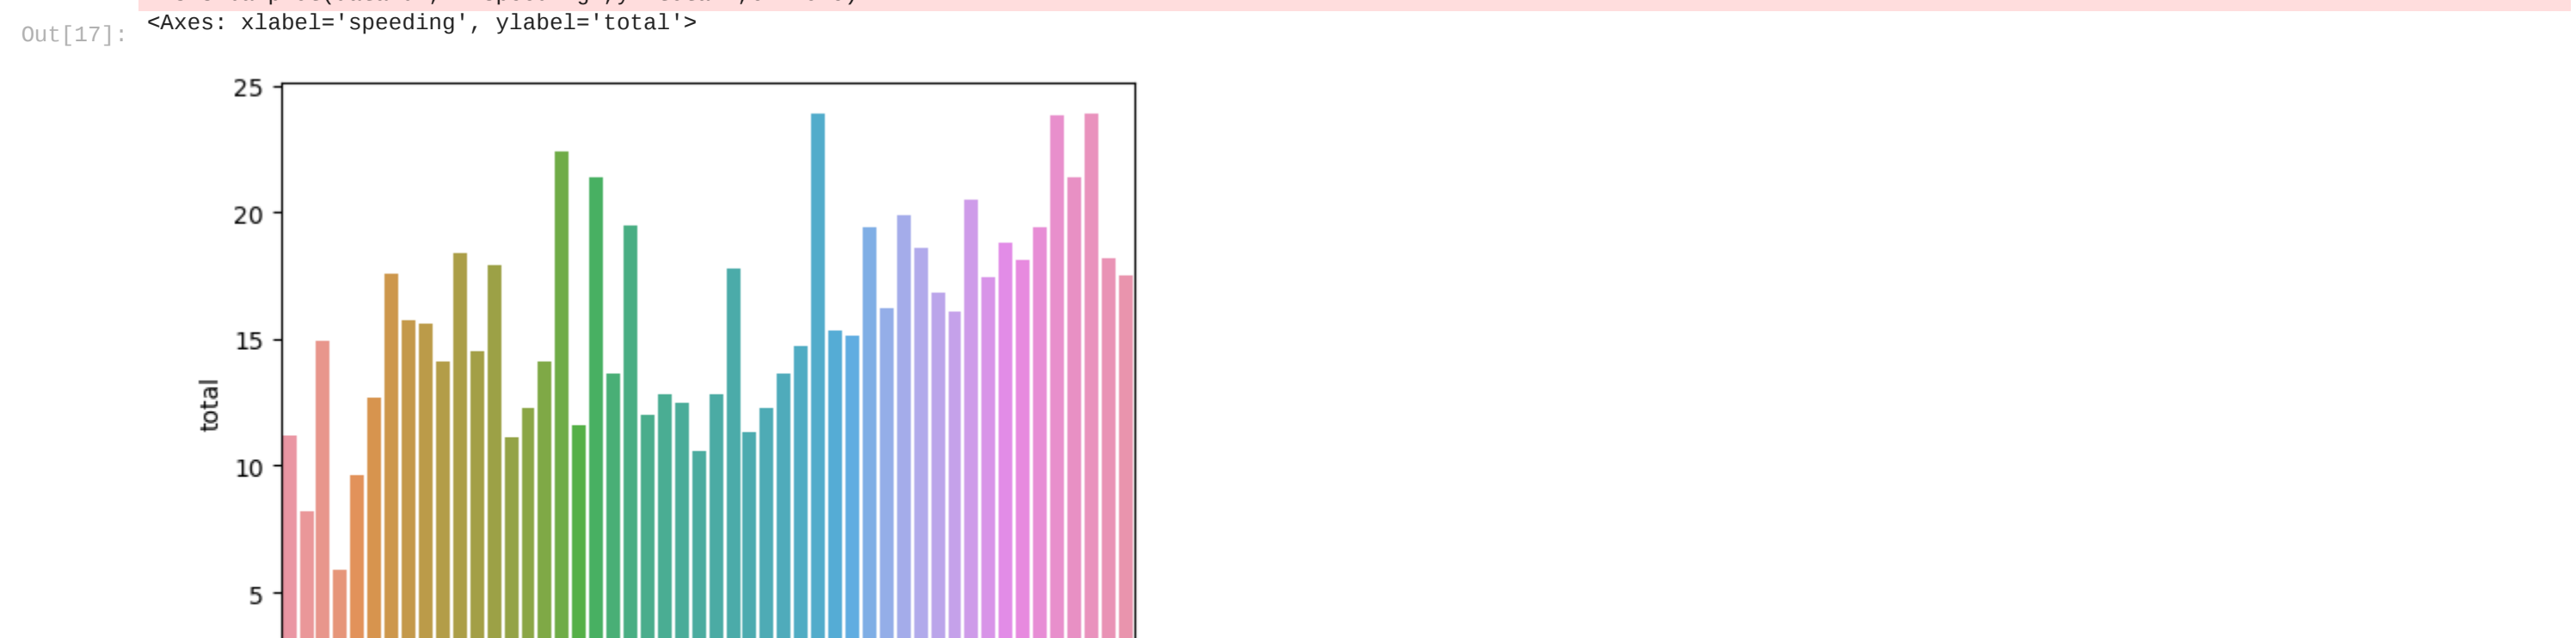

```
<seaborn.axisgrid.JointGrid at 8x19c11b0996>
```

Inference: The above is a jointplot of speeding and total we can observe that there is increase in both features.

```
In [40]: correlation=df.corr()
```

```
<Axes: >
```

Inference: The above is a correlation of the car crashes data, where each attribute is correlated with other of the car crash data
